DEAN, CCIT

ABSTRACT

This study aims to determine the level of efficiency of the Current Manual School Management and Proposed School Management Information System and correlate with the selected profile variables.

The descriptive method of research was used in the study with the questionnaire as main instrument in gathering data. Interviews and observations were also resolved to validate findings. The respondents were thirty four (34) from different places. The statistical tools were percentage, weighted arithmetic mean, variance and t-test.

Based on findings of the study comparing the effectiveness of the current and proposed computerized examination reviewer system, the researchers found out that the proposed system is efficient in terms of security of data and information, accuracy of data and information, speed processing and user-friendliness compared to the current manual school management. The current system gathered a total of 2.98 computed weighted mean which is interpreted as Moderately Efficient while the proposed system has a total of 4.63, qualitatively interpreted as Very Efficient. Therefore the researchers conclude proposed system should implement for Zambales National High School.

This study recommends the implementation of the system to the Zambales National High School which is more accurate, secured, speed process

and user- friendly. It is further recommended to the staff to encourage the users on system familiarization through continues computer literacy education.
