ABSTRACT

This project was created to replace the existing manual voting system of Ramon Magsaysay Technological University (RMTU) that had made inconvenience not only to the voters but also to the election facilitators. The researcher's goal was to develop a fast, secure, accurate, user-friendly system for a small scale election. The system is designed solely and is limited for the Supreme Student Government (SSG) election of RMTU and could append instantly voters and candidates.

Online Voting Systems for the election of SSG are widely used in elections. This paper describes using a Online Voting System as the basis for a project in an Information Technology course. Through the formulation of this system the students are indeed confident that the whole electoral process will not only be fast and quick but most of all accurate and precise. Effectiveness of the proposed Online Voting System for the election of SSG greatly reduces direct human control and influence in this process, and provides an opportunity to solve some old electoral problems, but it also introduces a whole range of new concerns. Therefore, the proposed online voting system can be expected to trigger more criticism and opposition than any other application in elections.
